

Sec**2**Pro

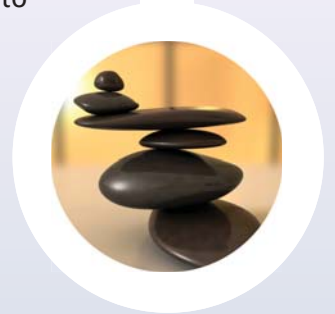

Taking **action**, upgrading
your level of **IT security**
You know why, **we know how**

Sec2Pro is a package of information security products from the BugSec IOP solution; Sec2Pro integrates technological security guidelines into each of the project's stages – from its initiation until its production. The purpose of the Sec2Pro package is to encompass the full range of elements that are critical to the organization as it prepares to develop a project. It places emphasis on issues such as:

- Checklists for the secure development process of applications;
- Checklists for the hardening procedure of systems and servers;
- Performance of validation checks before the production stage.

Numerous research studies prove that the integration of information security elements, such as secured development from the get-go, characterization and the application design are the most effective way of maintaining a proper information security policy, and the efficient way to meet strict information security standards and regulations.

Many organizations are required to comply with Information security regulations, such as PCI-VISA, BASEL II, HIPAA, SOX, etc. These security standards required the organization to meet clearly defined application security standards, as well as technological systems maintenance/operating security standards; therefore, numerous information security tests are conducted with the aim of detecting deficiencies and remedying them.

Sec2Pro

By assimilating Sec2Pro, information security managers provide strict guidelines for the developers and can perform online tracking of the integration and assimilation of these procedures into their organization.

- Observing the stages of the responses given to checklists.
- Printing reports containing data concerning non-compliance with regulations.
- Pinpointing the precise location of such irregularities.

Additionally, the Sec2Pro package saves the organization considerable resources that would have been allocated to carrying out inspections and verifying compliance to relevant regulations and procedures.

Best practice

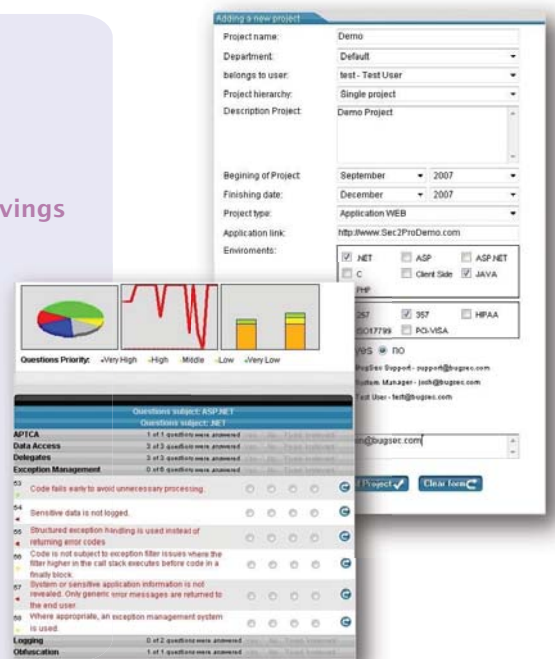

Provides developers with dynamic checklists and information security instructions throughout the development process, enabling immediate implementation of requires code modifications >>> **significant cost savings**

Synergy

Drill down hierarchy; all collaborators utilize the same system, with appropriate authorizations defined for each entity >>> **considerable savings in development resources**

Help desk

Technical support services assisting developers to maximize the benefits offered by Sec2Pro >>> **increased cost-efficiency**
